

Restoring Your Youthful Appearance with IPL and Nd:YAG

Intense Pulsed Light (IPL)

IPL is a photorejuvenation treatment. IPL is used to help eliminate redness, or dark pigmentation. It delivers bright light onto your skin. The light is then absorbed by broken capillaries, dark pigmentation or deeper by larger vessels and collagen. The capillaries shut down or coagulate, and pigmented areas darken and then slough off. This process gives the skin a more youthful, renewed appearance and a more radiant complexion. IPL is used to treat sun damage, sun spots, age spots (including sun-induced freckles), broken capillaries, spider veins, ruddy complexion, mottled pigmentation, and rosacea. A series of three to six treatments is recommended for best results.

Leg Vein Therapy with nd:YAG Laser

Spider Veins” are small, thin, red or blueish purple veins that are near the skin surface. We are equipped with two different light technologies for these vascular lesions. We may use either one or both, to help treat your skin. A small spot of laser light travels through the skin and is absorbed by the blood within the vein, on the basis of its color. The resulting heat coagulates or clots the blood and destroys the function of the vein. This process does not affect any of the surrounding tissue. Over time, the vein will be absorbed by the body and will disappear from sight. Nd:Yag laser is used for leg vein therapy, facial veins, large telangiectasias, venous lakes, and hemangiomas.

*A consultation is required before scheduling these treatments.
